     Sephacryl beads containing an immobilized aminopropylcobalamin-
     transcobalamin-II complex serve as foci for the adherence of L1210 murine
     leukemia cells. Bead-cell interaction did not occur when: nonderivatized
     beads were used; transcobalamin-II was omitted or presaturated with
     cyanocobalamin in the preparation of the bead complex; intrinsic factor
     replaced transcobalamin-II, and the complex was removed from beads by
     photolysis. Adherence apparently resulted from the ability of
     transcobalamin-II to form a bridge between immobilized
     cobalamin on the bead and receptors in the plasma membrane of the
     cell.
